

Os vulcões dos Açores

Secondary Volcanism

Secondary Volcanism

- Secondary volcanism consists of manifestation of volcanic activity which are less violent than eruptions.

Fumaroles

Fumaroles in São Miguel Island

- Water vapour emissions through cracks in the volcanic cone, which are frequently accompanied by other gases.

Thermal Springs

- Areas where water from underground is released and which were heated before reaching the surface. Some of these waters are rich in minerals.

Geisers

- High temperature water vapour emissions through cracks in the earth's crust. These emissions can reach hundreds of metres above the soil.
